Distributed energy storage for power supply companies

Overview

The Distributed Energy Storage solution powered by AI/ML uses the flexibility of backup power batteries to control the electricity supply in thousands of base stations in the mobile network throughout the day. The DES system optimizes the timing of electricity purchases by scheduling charging. Elisa's experience in its own network has shown a persuasive business case for DES, allowing operators to convert a traditional cost centre – mandatory backup energy storage – into a source of electricity purchasing cost savings and new revenue from. The DES solution is composed of three layers of control intelligence powered by AI software, harnessing the electricity and power equipment data to provide actionable. Renewable energy like wind power is inexpensive, CO2-free and abundant and is a key solution to the challenge of climate change. Exponential. Most mobile network operators have some backup power supply in their network infrastructure – often mandated by regulation – but also.
