

Introduction to photovoltaic inverter structure

Overview

Inverters used in photovoltaic applications are historically divided into two main categories: 1. Standalone inverters 2. Grid-connected inverters Standalone inverters are for the applications where the PV plant is not connected to the main energy distribution network. The. Let's now focus on the particular architecture of the photovoltaic inverters. There are a lot of different design choices made by. The first important area to note on the inverter after the input side is the maximum power point tracking (MPPT) converter. MPPT converters are DC/DC converters that have the specific purpose of maximizing the 1 power produced by the PV generator. Note. Next, we find the “core” of the inverter which is the conversion bridge itself. There are many types of conversion bridges, so I won't cover different bridge solutions, but focus instead on the bridge's general workings. In Figure 2, a three-phase inverter is. The most common method to achieve the MPPT algorithm's continuous hunting for the maximum power point is the “perturb and observe”.
