

Uninterruptible power supply layout

Overview

In a UPS, the energy is generally stored in flywheels, batteries, or super capacitors. When compared to other immediate power supply system, UPS have the advantage of immediate protection against the input power interruptions. It has very short on-battery run time; however. When the main power fails, the UPS supplies power for a short time. This is its primary role. Additionally, UPS can correct power problems like voltage spikes, noise, and frequency instability. The problems that can be corrected are voltagespike (sustained over. Applications of a UPS include: 1. Data Centers 2. Industries 3. Telecommunications 4. Hospitals 5. Banks and insurance 6. Some special projects (events) You can. Generally, the UPS system is categorised into On-line UPS, Off- line UPS and Line interactive UPS. Other designs include Standby on-line.
